

ConvertKit

Shopify Conversion and Store Design App

ConvertFlow

Liquid Code Extraction Engine — Built Inside ConvertKit

App 1 — ConvertKit	Merchant-facing Shopify app. Increases store conversion rate by 10-15%. Every feature works out of the box with zero developer knowledge required.
App 2 — ConvertFlow	Developer and agency tool built inside ConvertKit. Reads the merchant's already-connected Shopify theme via Admin API and generates production-ready Liquid code, CSS, and JSON schema instantly — no URL required.
Primary Users	ConvertKit: Shopify store owners (non-technical). ConvertFlow: Shopify developers, freelancers, and agencies.
Core Promise CK	Merchant pays \$19/month. App generates \$1,000 to \$3,000+ in new monthly revenue from recovered lost sales.
Core Promise CF	Developer selects any section from a visual picker. Gets production-ready Liquid, encapsulated CSS, and JSON schema in under 5 seconds.
Pricing	Free (limited), Pro \$19/month (includes ConvertFlow), Enterprise \$49/month
Tech Stack	Remix + Shopify CLI 3.x, Node.js 20, Prisma, PostgreSQL, Redis, Claude API, Shopify Admin API, esbuild, Monaco Editor
Launch Target	2,000 installs within 30 days. MRR above \$3,800 by end of day 30.
Document Version	v3.0 — Complete specification including all features, UX wireframes, technical architecture, engineering prompts, and launch strategy

Why these two products belong in one app:

A Shopify store owner installs ConvertKit to get more sales. A Shopify developer installs ConvertKit to build better stores faster. Both install the same app. The merchant never sees ConvertFlow. The developer gets a powerful code extraction tool as part of their Pro subscription. One app, two audiences, one price.

ConvertFlow's key advantage over every competitor: because the store is already connected via OAuth, no URL paste is needed. The developer opens the ConvertFlow tab, sees all sections listed visually, clicks Extract, and gets code in seconds. Competitors scrape public HTML. ConvertFlow reads the actual theme files.

Table of Contents

PART A — CONVERTKIT

- Section 1** — Vision, USP, and Go-to-Market Strategy
- Section 2** — Technical Architecture and Database Schema
- Section 3** — Feature Specifications — Sections, Themes, Pages
- Section 4** — Feature Specifications — Sticky Cart, AI Reviews, Urgency Maker
- Section 5** — Feature Specifications — Upsell Engine, Trust Tools, Analytics
- Section 6** — Onboarding UX — 5-Step Wizard with Wireframes

- Section 8** — Pricing, ROI Model, App Store Listing
- Section 9** — Engineering Prompt — ConvertKit Build Instructions

PART B — CONVERTFLOW

- Section 10** — ConvertFlow Overview and Competitive Advantage
- Section 11** — Technical Architecture — Extraction Pipeline and API Calls
- Section 12** — ConvertFlow UI and UX Specification with Wireframes
- Section 13** — Component Library — Save, Reuse, Share
- Section 14** — Code Output Examples — Liquid, CSS, JSON Schema
- Section 15** — Developer UX Principles and Quality Standards
- Section 16** — Engineering Prompt — ConvertFlow Build Instructions

LAUNCH AND QUALITY

- Section 17** — Pre-Launch Checklist and 30-Day Growth Targets

PART A — ConvertKit: Merchant Conversion and Store Design App

Section 1 — Vision, USP, and Go-to-Market Strategy

ConvertKit is not another bloated Shopify app. It is a precision-built conversion engine that gives any Shopify merchant — regardless of technical skill — the same storefront capabilities that 8-figure DTC brands pay \$50,000+ to custom-build. One install. One dashboard. No developer needed.

1.1 The Problem Being Solved

Most Shopify merchants lose 85 to 92 percent of visitors without a purchase. Their product is good. Their storefront fails to communicate trust, urgency, and value fast enough. Existing solutions are either too expensive (PageFly at \$99/month), too slow (200kb+ JavaScript injected), or too fragmented — merchants buy 5 separate apps to do what one should do. ConvertKit solves all three problems simultaneously.

1.2 The Three Pillars That Differentiate ConvertKit

Speed-first architecture	The entire storefront widget bundle is under 40kb gzipped and loads asynchronously with async and defer attributes. Zero Cumulative Layout Shift. No jQuery. No React on the storefront. Google Lighthouse score stays above 95 after install. This is the number one technical claim competitors cannot match.
All-in-one conversion stack	Prebuilt sections (30+), prebuilt themes (8), prebuilt pages (8), AI-powered review writing, urgency maker with 5 tools, sticky add-to-cart button, trust badges, upsell engine, post-purchase pages, bundle builder, and revenue analytics — all in one app at one price.
Measurable ROI guarantee	The dashboard shows merchants their exact conversion rate before and after ConvertKit, with real dollar revenue attributed to the app per month. Not impressions. Not clicks. Actual money. This single screen eliminates churn because merchants see the 130x return on their \$19 investment every time they log in.

1.3 Unique Selling Point in One Sentence

A merchant pays \$19/month. ConvertKit generates \$1,000 to \$3,000+ in new monthly revenue from sales they would have otherwise lost. The ROI is visible on the dashboard from day one.

1.4 Go-to-Market Strategy — 2,000 Installs in 30 Days

- Free plan with zero credit card requirement on install — removes all friction from first install

- Built-in viral loop: free plan shows a small 'Powered by ConvertKit' badge on the storefront linking to the App Store listing
- Shopify App Store SEO with exact keyword targeting: page builder, conversion rate optimization, sticky cart, urgency timer, review app, product page builder
- Launch on Shopify Partners Slack, r/shopify, Facebook Shopify groups, IndieHackers, and Product Hunt simultaneously on day one
- Affiliate program offering 30% recurring commission to Shopify Partners and developers who refer installs
- YouTube tutorials targeting 'how to increase Shopify conversion rate' — high search volume, low competition keyword
- Cold email outreach to 500 Shopify merchants per week showing their current missing features with a personalized store audit screenshot
- Free migration tool from PageFly and GemPages that imports existing sections — switching cost drops to near zero
- Developer community: ConvertFlow (Section 10+) creates a second viral loop within the Shopify developer community

Section 2 — Technical Architecture and Database Schema

2.1 Technology Stack

Framework	Remix with Shopify CLI 3.x — mandatory for Shopify App Store submission and embedded app authentication
Runtime	Node.js 20 LTS
Database ORM	Prisma with PostgreSQL — hosted on Supabase or Railway for managed infrastructure
Cache Layer	Redis via Upstash serverless — session storage, API response caching, rate limit management
Storefront Code	Vanilla JavaScript compiled with esbuild — absolutely no React on the storefront, no jQuery, no Lodash
Admin UI	React with Shopify Polaris design system — mandatory for Shopify App Store approval
AI Integration	Anthropic Claude API (claude-sonnet-4-20250514) for review writing and ConvertFlow extraction
File Storage	Cloudflare R2 or AWS S3 for theme asset uploads and library preview images
Deployment	Fly.io or Railway for the app server + Cloudflare CDN for widget scripts
Monitoring	Sentry for error tracking, PostHog for product analytics and funnel tracking
Email	Resend for transactional emails — onboarding sequences, review request emails
Code Editor	Monaco Editor loaded from CDN for ConvertFlow in-app editing

2.2 Performance Constraints — Non-Negotiable

- Widget scripts loaded with async and defer attributes — never blocking page render under any circumstance
- All widgets are tree-shaken and code-split: a merchant using only sticky cart loads only the sticky cart code, nothing else
- CSS injected inline or via a single stylesheet request — never multiple CSS file requests
- All Shopify Admin API calls batched where possible and cached in Redis with a 60-second TTL
- Storefront API calls use edge caching with 5-second stale-while-revalidate strategy
- Total JavaScript payload added to any storefront must not exceed 40kb gzipped — enforced by esbuild bundle size check in CI
- The ConvertFlow extraction endpoint must return in under 5 seconds — Claude API call is timed and logged

2.3 Database Schema

Shop	id, shopDomain (unique), accessToken, plan (free/pro/enterprise), installDate, settings (JSON), lastActiveAt, uninstalledAt
Section	id, shopId, type (hero/testimonial/faq/etc.), name, config (JSON), position, isActive, createdAt, updatedAt
Page	id, shopId, slug (unique per shop), title, content (JSON block-based), seoTitle, seoDescription, publishedAt, createdAt
Theme	id, shopId, name, previewImageUrl, cssVariables (JSON), isActive, appliedAt, createdAt
UrgencyTimer	id, shopId, productId (nullable), collectionId (nullable), deadline (datetime), displayType (countdown/scarcity/banner), message, isActive
ReviewRequest	id, shopId, orderId, customerId, productId, status (pending/sent/completed), generatedReview (text), sentAt, completedAt
AnalyticsEvent	id, shopId, eventType (pageview/feature_interact/purchase), value (decimal), featureName, sessionId, createdAt
Plan	id, name, priceMonthly, features (JSON array), stripeProductId, shopifyBillingId
Extraction	id, shopId, sectionKey, sectionName, rawLiquid, rawCSS, rawSchema, processedLiquid, processedCSS, processedSchema, themeCheckerPass (bool), errors (JSON), createdAt
LibraryItem	id, shopId, name, description, tags (text array), liquidCode, cssCode, schemaCode, previewImageUrl, isPublic, usageCount, shareToken, shareExpiresAt, createdAt
PushHistory	id, shopId, libraryItemId, targetThemeId, targetThemeName, pushedAt, status, errorMessage, backupLiquid

2.4 Required Shopify API Scopes

read_products, write_products, read_orders, write_orders, read_customers, write_customers, read_themes, write_themes, write_script_tags, read_script_tags, read_inventory, read_analytics, read_content, write_content

2.5 Required GDPR Webhooks

- customers/redact — delete all customer data for a specific customer on request
- shop/redact — delete all shop data when merchant requests data deletion
- customers/data_request — return all data held for a specific customer within 30 days
- app/uninstalled — immediately delete all shop data including LibraryItems, Extractions, and AnalyticsEvents

Section 3 — Feature Specifications — Sections, Themes, Pages

3.1 Prebuilt Sections Library — 30+ Sections at Launch

Sections are drag-and-drop blocks inserted into any Shopify page via theme app extensions (Shopify Online Store 2.0 app blocks). Every section is a self-contained HTML, CSS, and JavaScript component. All sections work on all Shopify themes without any custom code from the merchant.

Hero Sections — 5 variants

Split Layout Hero	Left text column with headline, subtext, and CTA button. Right column with product or lifestyle image. Mobile layout collapses to stacked. Animated text entrance using IntersectionObserver on scroll. Fully customizable via app block settings.
Video Background Hero	Full-width background video with text overlay and CTA. Video is lazy-loaded with a preload thumbnail. Fallback static image for mobile where video is blocked. Plays on loop, muted, autoplay.
Countdown Announcement Bar	Slim bar pinned to the top of the page with an embedded live countdown timer and a CTA link. Used for flash sales and limited-time offers. Configurable start and end dates.
Social Proof Scroll Bar	Horizontal auto-scrolling bar displaying press mention logos, certification badges, or partner logos. Speed and pause-on-hover configurable. Seamless infinite loop using CSS animation.
USP Icon Grid	Four-column icon grid showing unique selling points — free shipping, 30-day returns, secure checkout, etc. 40+ prebuilt icons. Each column has icon, headline, and short description text.

Product Enhancement Sections — 6 variants

Ingredients Breakdown	Accordion-style section showing product ingredients or materials with individual icons and descriptions. Used by beauty, food, and supplement brands. Each ingredient item is independently configurable.
Before and After Slider	Drag-to-reveal interactive image comparison slider showing product results. Touch-enabled with smooth dragging. Works on all mobile browsers. Widely used by skincare and fitness brands.
Product Benefits Grid	Three or four-column benefits grid with icon, benefit headline, and short description. Appears between product images and the description. Increases perceived value.
Tabbed Product Info	Tabbed section for Description, Ingredients, How to Use, and FAQ. Smooth tab switching animation. Mobile shows accordion instead of tabs. Reduces page length while keeping all information accessible.
Size and Fit Guide	Modal or inline table showing size charts with a unit toggle between cm and inches. Reduces sizing-related returns significantly. Configurable column headers for apparel, shoes, or other product types.
Complementary Products	Manually curated complementary product grid with product thumbnails, prices, and individual add-to-cart buttons. Configured in the app dashboard by selecting products from the merchant's catalog.

Trust and Social Proof Sections — 5 variants

Star Rating Summary	Aggregated review score display with a star breakdown chart (5-star count, 4-star count, etc.) pulled from Shopify product review metafields. Works with Judge.me, Okendo, and Shopify native reviews.
Press and Media Logos	Static or scrolling grid of media publication logos with an optional pull-quote beneath each. The classic 'As seen in' section. Logo images and links configurable per item.
Trust Badge Row	Horizontal row of trust signals: SSL secure, BBB accredited, free returns, money-back guarantee, US-based support. 40+ prebuilt badge icons. Fully customizable text per badge.
Customer Photo Reviews Grid	Masonry grid of customer photos with overlay star rating and review text. Supports image uploads via the review form widget. Integrates with Judge.me photo reviews.
Real-Time Purchase Notification	Toast popup in the bottom corner showing recent purchases: 'Sarah from Austin bought this 2 hours ago'. Pulls data from Shopify Orders API for the last 7 days. Requires minimum 5 real orders before activating — never shows fake data.

Conversion Sections — 6 variants

Standalone Countdown Timer	Full-width section containing a large countdown timer to a specific deadline. Shows days, hours, minutes, and seconds. Automatically hides when the deadline passes. Can be scoped to specific products or site-wide.
Stock Scarcity Progress Bar	Shows remaining inventory count with a visual progress bar. Pulls real inventory quantity from Shopify's Inventory API. Color changes based on stock level: green above 10, orange 5-10, red below 5. Updates on every page load.
Bulk Discount Tier Table	Visual table showing quantity-based pricing tiers: buy 1 for \$20, buy 3 for \$17 each, buy 5 for \$14 each. Integrates with Shopify automatic discounts or discount codes. Encourages larger order sizes.
Guarantee Section	Full-width guarantee block with a seal icon, bold guarantee headline, and terms text. Configurable guarantee duration (15, 30, 60, 90 days). Appears on product pages and cart page for maximum impact.
FAQ Accordion with Schema	Accordion FAQ section with schema.org FAQPage markup for Google rich results. AI-assisted FAQ generation based on the product description using the Claude API. Categories supported.
Email Popup Capture	Exit-intent or time-delayed popup offering a discount code in exchange for an email address. Connects to Klaviyo via their JavaScript API or to Shopify Email. Shows once per visitor per session.

3.2 Prebuilt Themes — 8 Complete Store Themes

A theme is a coordinated set of CSS variables applied to the Shopify theme via the Assets API — covering color palette, typography pair, border radius style, shadow style, and button style. Applied in one click from the onboarding wizard or the Themes tab. Merchant can further customize individual variables after applying.

Theme	Best For	Design Character
Luxe	Jewelry, fashion, beauty	Dark background, gold accents, serif headings (Cormorant)
Fresh	Health, wellness, organic food	White background, sage green accents, rounded 12px corners
Bold	Streetwear, sneakers, apparel	Black background, red or yellow accents, condensed bold typography
Clean	Electronics, tech accessories	Light gray background, blue accents, precise 4px grid layout
Warm	Home goods, candles, gifts	Cream background, terracotta accents, soft drop shadows
Sport	Fitness, supplements, activewear	Dark navy background, bright lime accents, impact condensed font
Minimal	Skincare, cosmetics, DTC beauty	Pure white background, single muted accent color, 48px+ line height
Artisan	Handmade, craft, specialty food	Textured off-white background, earthy brown and olive tones

3.3 Prebuilt Page Templates — 8 Complete Pages

Each page template is a complete, conversion-optimized page built from ConvertKit sections and served through Shopify Online Store 2.0 templates. Published with one click. Fully editable via the page builder after publishing.

Homepage	Hero section, USP grid, featured collection, customer photo reviews, press logos, email popup, FAQ section, trust badge row. The most impactful page for first-time visitors.
Product Launch Page	Countdown timer, product highlight sections, waitlist email capture, founder story section, early-bird pricing table, social share buttons. Used for pre-launch campaigns.
About Us Page	Brand story section with large typography, founder photo and bio, mission statement, team member grid, brand timeline milestones. Builds the human connection.
FAQ Page	Categorized FAQ accordion with search input, schema markup for Google rich results, contact CTA at the bottom. Reduces support tickets.
Contact Page	Contact form, store location and hours, Google Maps embed, social media links, expected response time message. Professional and trust-building.
Bundle Builder Page	Curated product selection grid where customers build their own bundle, automatic discount calculation displayed live, single add-to-cart for the entire bundle.

Post-Purchase Page	Order confirmation summary, upsell offer with one-click add (Shopify post-purchase extension), loyalty points display, referral widget, social share prompt.
Coming Soon Page	Email capture with countdown timer, teaser product images, social follow buttons, progress bar showing signups toward a launch goal. Used for pre-launch stores.

Section 4 — Feature Specifications — Sticky Cart, AI Reviews, Urgency Maker

4.1 Sticky Add to Cart Button — Complete Technical Specification

The sticky add to cart button is the highest-impact single feature in ConvertKit. It is a persistent bar that follows the customer as they scroll down the product page, ensuring the buy button is always visible. This single feature produces measurable conversion lifts on any product page where the native add-to-cart button scrolls above the viewport.

- Appears when the native add-to-cart button scrolls above the viewport — detected via IntersectionObserver API, not scroll events
- The sticky bar contains: product thumbnail (48x48px), product title truncated to 40 characters, selected variant name, current price, and the add-to-cart button
- Variant selection on the sticky bar is two-way synced with the main product form — changing the variant in either location updates both
- The add-to-cart action uses Shopify's native AJAX cart API (section rendering API) — no page reload, instant cart update
- After adding to cart: sticky bar shows a check mark animation for 1.5 seconds then displays a 'View Cart' link
- Hidden on mobile viewports under 768px by default with a toggle in the dashboard to enable it on mobile
- Slides in from the bottom with a 200ms ease-out CSS transition — zero Cumulative Layout Shift
- The entire sticky bar JavaScript and CSS is under 8kb gzipped — measured and enforced by esbuild
- Multiple variants support: color swatches and dropdown selectors both supported
- Out-of-stock handling: sticky bar shows 'Notify me' button when variant is out of stock, triggering email capture

4.2 AI Review Writing — Complete Flow

AI review writing uses the Claude API to help customers who want to leave a review but do not know what to write. The result is higher quality reviews, more reviews submitted, and better SEO signals from longer, more detailed review text.

Step 1 — Trigger	After order delivery (configurable delay: 7, 14, or 21 days), ConvertKit sends an automated review request email via Shopify Email or Klaviyo webhook integration.
Step 2 — Landing	Customer clicks the review link in the email and lands on a branded review form page hosted by ConvertKit via a Shopify storefront proxy URL.
Step 3 — Star rating	Customer selects a star rating (1-5). The form then shows 2-3 guided questions based on the rating: positive ratings show 'What did you love most?' and 'What problem did it solve?'. Negative ratings show 'What could be improved?'.

Step 4 — AI assist	If the customer clicks 'Help me write this', the app sends their star rating, product name, product category, and question answers to the Claude API.
Step 5 — Claude output	Claude generates a first-person, natural-sounding review draft that the customer can edit before submitting. The draft is 40 to 120 words, uses conversational language, and avoids marketing superlatives.
Step 6 — Submission	The submitted review is stored in the database and optionally pushed to Shopify Product Reviews, Judge.me, or Okendo via their respective APIs.

Claude system prompt for review writing (exact text):

You are helping a real customer write a product review. The review must sound like a genuine human wrote it. No marketing language. No superlatives like 'amazing' or 'life-changing'. Use simple, conversational language. First person. 40 to 120 words. Do not mention the brand name more than once.

4.3 Urgency Maker — 5 Tools, All Using Real Shopify Data

Every urgency signal in ConvertFlow is sourced from real Shopify data. No fake countdown timers that reset every 24 hours. No fabricated purchase notifications. If the real data does not meet the minimum threshold, the feature does not show — ever.

Inventory Scarcity Counter	Displays 'Only X left in stock' when inventory falls below a configurable threshold (1 to 20 units). Pulls real inventory quantity from Shopify's Inventory API. Shows a colored progress bar: green above 10 units, orange 5 to 10, red below 5. Updates on every page load with a 60-second Redis cache to avoid rate limits.
Sale Countdown Timer	A real deadline countdown showing days, hours, minutes, and seconds until a sale end date. Set the deadline once in the dashboard. Automatically hides when the deadline passes — it does not reset. Can be scoped to specific products, specific collections, or site-wide. If no deadline is set, the feature does not show.
Recent Buyer Notification	Toast notification in the bottom corner showing real recent orders: 'Sarah from Austin just bought this 2 hours ago'. Pulls data from Shopify Orders API for the last 7 days. Requires a minimum of 5 real orders before the feature activates. The merchant cannot override this minimum — it exists to prevent misleading social proof on new stores.
Cart Threshold Progress Bar	A progress bar in the cart drawer and product page showing how close the customer is to free shipping or a discount tier. 'Add \$12 more for free shipping'. Dynamically updates in real time as the customer adds or removes items. Threshold amounts are configurable in the dashboard.

Time-Sensitive Offer Banner	A dismissible banner at the top of the page showing a time-limited offer with an embedded mini countdown. 'Order in the next 2h 14m for same-day dispatch'. Configurable per-product or site-wide. The countdown is real — it runs from the time the customer first lands on the page and does not reset on refresh.
------------------------------------	--

Section 5 — Feature Specifications — Upsell Engine, Trust Tools, Analytics

5.1 Upsell Engine

In-Cart Upsell Popup	When a customer adds a product to cart, a modal appears with one complementary product recommendation and a one-click add offer. The recommendation is rule-based: the merchant sets product pairings manually in the dashboard. No AI — the merchant knows their best pairings. The popup has a 3-second delay and a clear dismiss button. Converts at 8 to 12 percent on average for well-configured stores.
Post-Purchase Upsell Page	After Shopify checkout completes, the customer is redirected to a ConvertKit-hosted thank-you page using the Shopify post-purchase extension. The page shows a single upsell product with a one-click purchase button that charges the customer's saved payment method without re-entering card details. The highest-converting upsell placement in any Shopify store.
Bundle Builder Widget	An embeddable widget on product pages that lets customers build their own bundle from a curated product set. Each bundle combination shows the calculated savings. The entire bundle is added to cart with one click as individual line items with a bundle discount applied automatically via Shopify automatic discounts API.
Frequently Bought Together	A widget below the product form showing 2 to 4 products commonly purchased with the current product. The merchant configures the pairings manually. Customers can select or deselect individual items. One-click add for all selected items simultaneously.

5.2 Trust and Credibility Tools

Trust Badge Builder	Drag-and-drop badge selector with 40+ prebuilt trust icons: SSL secured, BBB accredited, McAfee protected, free returns, money-back guarantee, US-based support, and more. Each badge has configurable icon and text. Inserts as an app block anywhere in the theme — below add-to-cart button, in the footer, or as a standalone section.
Verified Review Display	Fast, clean review display widget showing star rating, review text, reviewer first name and city, verified purchase badge, and review date. Renders in under 10ms. No third-party dependencies. Supports text reviews and photo reviews. Schema markup included for Google rich results.
Money-Back Guarantee Banner	Configurable guarantee section with a seal graphic, bold headline, guarantee duration (15, 30, 60, or 90 days), and terms text. Shows on product pages and the cart page. One of the highest-trust signals available for any product category.

Security Seals Display	Displays recognized security certification logos near the checkout button. Shopify secure checkout badge, SSL certificate visual, and payment method icons (Visa, Mastercard, Apple Pay, Google Pay, PayPal). Pulls the merchant's actual accepted payment methods from Shopify.
-------------------------------	--

5.3 Revenue Attribution Analytics Dashboard

The analytics system is the primary retention driver. Merchants stay because they can see exactly how much money ConvertKit made them this month. The system uses a lightweight event tracking layer that writes to the AnalyticsEvent table in batches of 50 events using a queue pattern to avoid blocking the storefront.

Conversion Rate Tracker	Shows conversion rate by day for the last 30, 60, and 90 days. Marks the date each ConvertKit feature was activated with a vertical line on the chart so merchants can see the direct before-and-after impact.
Feature Performance Report	For each active feature, shows: impressions (times shown), interaction rate (percentage of visitors who engaged), and attributed revenue (revenue from sessions where the feature was engaged). Sorted by attributed revenue descending.
Revenue Attribution Total	Shows total revenue from sessions where at least one ConvertKit feature was engaged. This number updates daily. It is the primary metric shown on the Overview screen and is the number that justifies the subscription every month.
Session Funnel	Shows the full funnel for ConvertKit-engaged sessions: landed on page > viewed feature > interacted with feature > added to cart > reached checkout > purchased. Shows drop-off at each stage to identify optimization opportunities.

Section 6 — Onboarding UX — 5-Step Wizard with Wireframes

The first 10 minutes after install determines whether a merchant activates and stays forever or uninstalls before seeing any value. The onboarding wizard is designed around one principle: get the merchant something visible on their live store within 5 minutes, before they finish their first cup of tea.

6.1 Onboarding Design Rules

- One screen. One decision. One button. Never show two choices on the same screen at the same time
- Progress dots visible at the top of every step — 5 dots, filled as the merchant progresses
- Every step ends with a 'View on store' link so the merchant sees the change on their actual storefront immediately
- No forms with multiple fields. Use toggles, visual cards, and single-click selections
- Every step has a 'Set up later' option — never force a step that blocks progress
- The entire wizard must be completable in under 10 minutes — tested and timed with real merchants
- Error states must be friendly and action-oriented: 'Something went wrong — tap here to retry'

Step 1 of 5 — Automated Store Audit (60 seconds)

Immediately after OAuth, the app runs a silent store audit checking for 8 key missing features. The merchant sees a visual scorecard before touching any settings — they understand the problem instantly.

Step 1 — Your store health check (runs automatically)

We scanned your store. Here is what we found:

Sticky cart button	MISSING	Fix this ->
Trust badges	MISSING	Fix this ->
Urgency signals	MISSING	Fix this ->
Review display	PARTIAL	Improve ->

Fix all of these now ->

Step 2 of 5 — Pick a Theme (90 seconds)

Show the 8 prebuilt themes as large visual cards. One click applies the theme to the live store via the Shopify Assets API. This is the merchant's first visible win — their store looks more professional without touching a line of code.

Step 2 — Pick a theme that fits your brand

Choose your starting style. You can always change this later.

Selected: Luxe | [Preview live on your store ->](#)

[Apply Luxe theme to my store ->](#)

Step 3 of 5 — Activate 3 Quick Wins (120 seconds)

Three toggles in the exact order of impact: sticky cart first (highest immediate conversion lift), then inventory scarcity, then trust badges. Each activates on the live store immediately. The 'View on store' link opens after each toggle so the merchant sees the result.

Step 3 — Turn on your three most important tools

Each toggle below activates instantly on your live store. Click View to see it.

Step 4 of 5 — Set Up Review Requests (60 seconds)

One decision — when to send the review email after delivery. Show a live preview of the email template. One toggle to activate. AI writing is teased here as a Pro feature to drive upgrade intent.

Step 4 — Start collecting better reviews automatically

How many days after delivery should we send the review request?

7 days

14 days

21 days

AI review writing: helps customers write better reviews with one click [Pro feature]

[Preview email template ->](#)

[Activate review requests ->](#)

Step 5 of 5 — Dashboard and Plan Upgrade (60 seconds)

Show the revenue attribution dashboard with an estimate based on the merchant's actual traffic data. Surface the 3 features locked behind Pro. This is the primary free-to-paid conversion moment — the merchant sees the money they are leaving on the table by staying on free.

Step 5 — Your store is live. Here is what ConvertKit could earn you.

Based on your current traffic, ConvertKit Pro could generate:

\$840

Estimated new revenue / month

from recovered lost sales

Unlock to get this: AI reviews, post-purchase upsell, bundle builder, ConvertFlow code tool

[Upgrade to Pro — \\$19/month](#)

[Stay on Free](#)

Section 7 — Dashboard UX — All 9 Screens with Wireframes

7.1 Navigation Structure

Left sidebar with 10 navigation items. Always visible on desktop. Collapsible on mobile. Active state: solid left border in ACCENT color. Feature count badge shown on applicable items. 'NEW' badge shown on recently released features for 30 days.

Nav Item	What it Shows
Overview	Conversion rate graph, attributed revenue this month, active features, store head
Sections	Filterable grid of 30+ sections with add-to-store and configure buttons
Pages	All published ConvertKit pages with edit, preview, publish, and delete actions
Themes	8 theme presets with one-click apply and CSS variable customizer
Urgency Tools	Unified panel for all 5 urgency maker components with status indicators
Reviews	Review request settings, submitted review list, AI generation log
Upsells	Upsell rule configuration, bundle builder setup, post-purchase page editor
Analytics	Full conversion and revenue dashboard with 30/60/90-day date range filter
ConvertFlow	Liquid code extraction engine — Pro plan only, teal accent color in nav
Settings	Billing, plan management, widget customization, integration API keys

7.2 Overview Screen — Primary Dashboard

First screen seen on every login. Must answer three questions in under 5 seconds: how is my store performing, what did ConvertKit earn me this month, what should I do next.

Overview — Your store performance at a glance

Conversion rate: 3.1%

Revenue attributed: \$1,240

Was 1.8% before ConvertKit

This month from ConvertKit

[Conversion rate line chart — 30 days, ConvertKit activation marked]

Section 8 — Pricing, ROI Model, App Store Listing

8.1 Pricing Tiers

Plan	Price	Includes
Free	\$0/month	Sticky cart, 3 sections, 1 theme, basic analytics, 100 events/month
Pro	\$19/month	All 30+ sections, all 8 themes, all 8 page templates, all urgency tools, AI review writing, upsell engine, bundle builder
Enterprise	\$49/month	Everything in Pro plus white-label badge removal, multi-store management (up to 10 stores), custom CSS injection

8.2 The ROI Math — Why \$19 Is a Guaranteed Yes

Example: mid-size Shopify store before ConvertKit

Traffic: 1,000 visitors per day | Conversion rate: 1.5% | Average order value: \$60

Monthly revenue: $1,000 \times 30 \times 0.015 \times \$60 = \text{\$27,000/month}$

After ConvertKit Pro — conservative improvement scenario:

Conversion rate improves to 2.5% (sticky cart, urgency, trust badges doing their job)

Average order value improves to \$69 (upsell engine adding \$9 per order on average)

Monthly revenue: $1,000 \times 30 \times 0.025 \times \$69 = \text{\$51,750/month}$

New revenue attributed to ConvertKit: $\text{\$51,750} - \text{\$27,000} = \text{\$24,750/month}$

App cost: \$19/month. Return on investment: 1,302x. The ROI case is not a claim — it is math.

8.3 Shopify App Store Listing Specification

App Name	ConvertKit - CRO and Store Design
Tagline	Convert more visitors. One app. Zero slowdown.
Category	Store design, Marketing, Conversion optimization
Primary Keyword	conversion rate optimization
Secondary Keywords	sticky add to cart, page builder, urgency timer, review app, product page builder, shopify sections
Description Hook	Most Shopify stores convert 1-2% of visitors. ConvertKit helps stores hit 3-4% using proven conversion design applied in under 10 minutes.

Review Target	4.7+ star average on Shopify App Store within 30 days of launch
Support Email	support@convertkit-app.com
Privacy Policy	Hosted at app domain /privacy — required for App Store submission

Section 9 — Engineering Prompt — ConvertKit Build Instructions

Paste the following block directly into Claude Code, Cursor, or any AI coding assistant to begin building ConvertKit. This contains all technical constraints, priority order, scope, and security requirements.

Build a production-grade Shopify app called ConvertKit using Shopify CLI 3.x Remix template. Must pass Shopify App Store review on first submission.

TECH STACK:

Node.js 20, Remix, Prisma + PostgreSQL, Redis (Upstash), Shopify Polaris for admin UI, Vanilla JS + esbuild for storefront widgets (no React on storefront), Tailwind for admin.

SHOPIFY SCOPES:

read_products, write_products, read_orders, write_script_tags, read_themes, write_themes, read_customers, write_customers, read_inventory, read_analytics, read_content, write_content.

BUILD PRIORITY ORDER:

1. OAuth install flow with PostgreSQL session storage
2. Shopify Billing API – Free, Pro \$19/mo, Enterprise \$49/mo
3. Script tag injection loading the ConvertKit widget bundle on storefront
4. Sticky Add to Cart widget (highest priority feature, under 8kb)
5. Section library – first 10 sections: hero-split, video-hero, usp-grid, trust-badges, scarcity-bar, countdown-timer, faq-schema, star-rating, before-after, email-popup
6. Theme preset system (8 themes via Shopify Assets API CSS variable injection)
7. 5-step onboarding wizard as specified in Section 6
8. Urgency Maker suite – all 5 tools, real Shopify data only
9. AI Review Writing – Claude API (claude-sonnet-4-20250514)
10. Prebuilt pages (8 templates via storefront proxy)
11. Upsell engine – in-cart popup + post-purchase Shopify extension + bundle builder
12. Analytics dashboard with revenue attribution event tracking

PERFORMANCE RULES (non-negotiable):

- Storefront widget bundle under 40kb gzipped – CI fails if exceeded
- All widgets use IntersectionObserver for lazy init
- Zero Cumulative Layout Shift on any widget
- Shopify API calls cached in Redis TTL 60s

SECURITY:

- HMAC verification on all Shopify webhooks
- All data scoped to shopDomain
- JWT session tokens (Shopify standard)
- app/uninstalled webhook deletes ALL shop data immediately

UX RULE: Zero technical jargon in any UI copy. Every empty state shows exactly one next action. Every feature activates with one toggle and works correctly with default settings.

PART B — ConvertFlow: Liquid Code Extraction Engine Inside ConvertKit

Section 10 — ConvertFlow — Overview and Competitive Advantage

ConvertFlow in one sentence:

A Shopify developer opens the ConvertFlow tab inside ConvertKit, sees their store's sections listed visually, clicks Extract on any section, and receives production-ready Liquid code, encapsulated CSS, and a fully editable JSON schema in under 5 seconds — ready to edit in Monaco Editor and push directly to any connected Shopify theme. No URL paste. No scraping. No waiting.

10.1 The Key Insight — Why ConvertFlow Beats Every Competitor

Every competitor in the Liquid extraction space — including liquid-fund.com — requires the developer to paste a public Shopify store URL. The tool then scrapes the rendered HTML and attempts to reverse-engineer Liquid from DOM output. This approach has fundamental limitations:

Competitor (URL-based)	ConvertFlow (OAuth-based)
Developer must paste a URL for every extraction	Store already connected via ConvertKit OAuth — zero extra steps
Scrapes rendered HTML — cannot access Liquid source	Reads actual .liquid theme files via Shopify Admin API
Cannot access JSON schema — must guess at settings	Reads actual {% schema %} block from the theme file directly
Cannot access Shopify CSS variables or theme settings	Reads assets.css and settings_data.json from theme
Code requires heavy manual cleanup to be usable	Code is authentic theme output, passes Theme Checker immediately
Only works on public store pages	Works on any theme file including development theme files
No push-to-theme capability	Push extracted and edited code directly to any connected theme

10.2 What ConvertFlow Generates on Every Extraction

Liquid template

A complete, self-contained Shopify section .liquid file. All hardcoded text strings replaced with schema settings of type text or richtext. All hardcoded image URLs replaced with image_picker settings using the image_url filter with WebP format. All hardcoded colors replaced with color settings. No deprecated Liquid tags.

Encapsulated CSS	All CSS classes namespaced under .cf-sectionname-element following BEM convention. No styles leak outside the section. No conflicts with existing theme styles. Responsive breakpoints at 768px and 480px always included. CSS custom properties used for color values.
JSON schema	A complete schema block with name, class, settings array, and blocks array where relevant. All settings have id, type, label, and default values. Passes Shopify official theme-check CLI validation with zero errors. Compatible with Shopify Online Store 2.0 section rendering.
Combined file	A single .liquid file containing all three components: the Liquid template, a style tag with the encapsulated CSS, and the schema block at the bottom. Ready to drop directly into any Shopify theme sections directory and render immediately.

Section 11 — ConvertFlow — Technical Architecture and API Calls

11.1 The 6-Step Extraction Pipeline

Step 1 — Auth	ConvertFlow uses the merchant's Shopify OAuth session already stored in ConvertKit's PostgreSQL database. No additional authentication. The developer just opens the ConvertFlow tab — the connection is already there.
Step 2 — Theme Read	ConvertFlow calls <code>GET /admin/api/2024-01/themes.json</code> to identify the active theme. It caches the theme ID in Redis with a 5-minute TTL. Then calls <code>GET /admin/api/2024-01/themes/{id}/assets.json</code> to list all files in the theme's sections/ directory.
Step 3 — Visual Index	ConvertFlow builds a visual index of all sections: name derived from file key, section type inferred from the schema name field, settings count from the schema settings array length, and preview thumbnail generated from the Shopify theme preview URL with the <code>section_id</code> param.
Step 4 — File Fetch	When the developer clicks Extract, ConvertFlow calls <code>GET /admin/api/2024-01/themes/{id}/assets.json?asset[key]=sections/{name}.liquid</code> to read the raw Liquid file content including the embedded <code>{% schema %}</code> block.
Step 5 — AI Process	The raw Liquid and schema are sent to the Claude API (claude-sonnet-4-20250514, max_tokens: 4000). Claude cleans the code, replaces hardcoded values with schema settings, encapsulates CSS, adds WebP image handling, and adds responsive breakpoints. The response is parsed into four sections: LIQUID, CSS, SCHEMA, COMBINED.
Step 6 — Validate	ConvertFlow runs the generated Liquid through the <code>@shopify/theme-check-node</code> package as a child process on the app server. The validation result (pass/fail, errors array, warnings array) is returned alongside the code. The Push to Theme button is disabled if Theme Checker fails.

11.2 Shopify Admin API Calls Used by ConvertFlow

GET /themes	Lists all themes for the shop. Used to identify the active theme (role=main) and available development themes (role=development).
GET /assets list	<code>GET /themes/{id}/assets.json</code> — lists all files. ConvertFlow filters for keys starting with 'sections/' to build the section picker.

GET /assets single	GET /themes/{id}/assets.json?asset[key]=sections/{file}.liquid — reads one theme file. Returns the full Liquid source code with embedded schema.
PUT /assets	PUT /themes/{id}/assets.json with body {asset: {key: 'sections/name.liquid', value: processedCode}} — writes the new section file to the theme.
DELETE /assets	DELETE /themes/{id}/assets.json?asset[key]=... — removes a file. Used only in library cleanup, never used automatically.
GET /pages	GET /admin/api/2024-01/pages.json — lists all store pages for page-level extraction in the Pages tab.

11.3 Claude API Integration — Exact Prompt Structure

System prompt for ConvertFlow extraction (exact text):

You are a Shopify Liquid expert. You receive raw Liquid code and CSS from a Shopify theme section file. Your job is to output a cleaned, production-ready version. Follow these rules exactly: (1) All hardcoded text strings must become schema settings of type text or richtext. (2) All hardcoded image URLs must become image_picker settings using image_url filter with format: webp and a width parameter. (3) All hardcoded hex colors must become color settings. (4) All CSS classes must be prefixed with .cf-{section-name}__ using BEM convention. (5) CSS must include responsive breakpoints at 768px and 480px. (6) Schema block must include name, class, and a complete settings array with id, type, label, and default for each setting. (7) Use render not include for all sub-snippets. (8) All code must pass Shopify theme-check with zero errors. Output exactly four clearly labelled sections: LIQUID, CSS, SCHEMA, COMBINED. No explanations. Code only.

Section 12 — ConvertFlow — UI and UX Specification with Wireframes

12.1 ConvertFlow Navigation Placement

ConvertFlow appears as item 9 in the ConvertKit left sidebar, between Analytics and Settings. It uses the teal CF accent color for its nav indicator to visually distinguish it from the rest of the app. On Free plan it shows with a lock icon and 'Pro' badge. On Pro and Enterprise it is fully unlocked.

ConvertKit sidebar — ConvertFlow nav item highlighted

Overview

Sections

Urgency Tools

Analytics

ConvertFlow [NEW — Pro]

Settings

12.2 Main Screen — Section Picker (No URL Needed)

When the developer opens ConvertFlow, all sections from their connected theme are already loaded. The screen shows: a tab bar across the top (All Sections, Pages, My Library, Shared), the theme name and section count, and a list of all section files with extract buttons.

ConvertFlow — Sections automatically loaded, no URL required

All Sections (14)

Pages (6)

My Library (8)

Shared

Theme: Dawn 14.2 | 14 sections detected | Last synced 2 minutes ago | Sync now

hero-banner.liquid	Extract ->	Preview
featured-collection.liquid	Extract ->	Preview
testimonials.liquid	Extract ->	Preview
product-form.liquid	Extract ->	Preview
footer.liquid	Extract ->	Preview

12.3 Code Output Screen — 4 Tabs with Monaco Editor

After extraction completes (under 5 seconds), the developer sees four output tabs: Liquid, CSS, Schema, Combined. Each tab has a Monaco editor (read-only by default), an Edit toggle, a Copy button, a Save to Library button, and a Push to Theme button. Theme Checker result shown as a badge.

12.4 Push to Theme — Safe Confirmation Flow

Any write operation to a Shopify theme requires explicit confirmation with a clear description of what will change. Default target is always the development theme, never the active live theme.

Section 13 — ConvertFlow — Component Library

The library is the retention engine for developers and agencies. Every extracted section saved becomes a permanent reusable asset across every store they manage. An agency with 20 client stores saves each well-built section once and deploys it to any store in one click.

13.1 Library Features

Save to Library	Any extracted section is saved with a custom name, description, and tags. The library item stores Liquid, CSS, schema, preview thumbnail, and usage count. Tags support filtering: hero, product, trust, footer, conversion, etc.
Push to Any Store	From the library, the developer selects any section and sees a dropdown of all Shopify stores connected to any ConvertKit account on their subscription. One-click push to the selected store. Same safe confirmation flow with development theme defaulting.
Share Link	Any library item can be shared via a secure token-based URL that expires in 7 or 30 days (developer chooses). The recipient can preview the code and copy it without a ConvertKit account. This is the viral growth mechanic — one developer shares a component, the recipient sees ConvertFlow.
Import from Share	A developer who receives a share link and has a ConvertKit account can import the section into their own library with one click from the share preview page.
Usage Analytics	Each library item shows: times extracted, times pushed to a theme, times shared, last pushed date. Agencies use this to identify their most valuable template components.
Backup and Restore	Before every push, ConvertFlow saves the original theme file content as a BACKUP-prefixed library item. The developer can restore any previous version of any theme file from the library at any time.

ConvertFlow — My Library screen

My Library (8 saved components) Search by name or tag...

hero-split-dark	Used 6x	Push to Store ->	Share
testimonials-v2	Used 3x	Push to Store ->	Share
product-media-tabs	Used 9x	Push to Store ->	Share
BACKUP-hero-banner-original		Restore	

Section 14 — ConvertFlow — Code Output Examples

14.1 Sample Liquid Output

The following is exactly what ConvertFlow outputs in the Liquid tab after processing a hero section. All hardcoded values have been replaced with schema settings. Images use WebP. Schema block is complete.

```
{%- assign image = section.settings.image -%}
{% assign heading = section.settings.heading -%}
{% assign subtext = section.settings.subtext -%}

<div class="cf-hero-banner__wrapper">
  <div class="cf-hero-banner__media">
    {% if image != blank -%}
      
    {% endif -%}
  </div>
  <div class="cf-hero-banner__content">
    <h2 class="cf-hero-banner__heading">{{ heading | escape }}</h2>
    <p class="cf-hero-banner__subtext">{{ subtext | escape }}</p>
    <a href="{{ section.settings.cta_url }}"
      class="cf-hero-banner__cta">
      {{ section.settings.cta_label | escape }}
    </a>
  </div>
</div>

{% schema %}
{
  "name": "Hero Banner",
  "class": "cf-hero-banner",
  "settings": [
    { "type": "image_picker", "id": "image", "label": "Background image" },
    { "type": "text", "id": "heading", "label": "Heading",
      "default": "Your headline here" },
    { "type": "textarea", "id": "subtext", "label": "Subtext" },
    { "type": "text", "id": "cta_label", "label": "Button label",
      "default": "Shop now" },
    { "type": "url", "id": "cta_url", "label": "Button link" }
  ]
}
{% endschema %}
```

14.2 Sample CSS Output — Fully Encapsulated

Every class is scoped under the section namespace. No global styles. Responsive breakpoints always included.

```
.cf-hero-banner__wrapper {
  position: relative;
  display: grid;
  grid-template-columns: 1fr 1fr;
  min-height: 480px;
  overflow: hidden;
}
.cf-hero-banner__media img {
  width: 100%;
  height: 100%;
  object-fit: cover;
}
.cf-hero-banner__content {
  display: flex;
  flex-direction: column;
  justify-content: center;
  padding: 40px 48px;
  gap: 16px;
}
.cf-hero-banner__heading { font-size: 2.4rem; font-weight: 700; }
.cf-hero-banner__subtext { font-size: 1rem; opacity: 0.8; }
.cf-hero-banner__cta {
  display: inline-block;
  padding: 12px 28px;
  background: var(--color-button);
  color: var(--color-button-text);
  border-radius: 4px;
  text-decoration: none;
}
@media (max-width: 768px) {
  .cf-hero-banner__wrapper { grid-template-columns: 1fr; }
  .cf-hero-banner__content { padding: 24px; }
  .cf-hero-banner__heading { font-size: 1.8rem; }
}
@media (max-width: 480px) {
  .cf-hero-banner__heading { font-size: 1.4rem; }
  .cf-hero-banner__cta { width: 100%; text-align: center; }
}
```

Section 15 — ConvertFlow — Developer UX Principles and Quality Standards

15.1 Developer UX Principles

ConvertFlow is built for technical users. The UX principles are different from ConvertKit's merchant-facing design. Developers want speed, precision, and transparency. They distrust magic and surprises.

Show the raw code	Always show actual Liquid, CSS, and schema. Never hide code behind visual abstractions. Developers want to verify what they are getting before pushing anything to a live theme.
Explain every change	Before any write to a theme, show a clear diff view of what will change. 'This replaces 47 lines with 82 lines in hero-banner.liquid.' The developer sees exactly what changes before clicking confirm.
Never auto-push	ConvertFlow never writes to a theme without explicit developer confirmation. Every push requires at least one confirmation click with a visible description of the target file and theme name.
Default to dev theme	The push confirmation always defaults to the development theme. The developer must explicitly select the active (live) theme. This prevents accidental overwrites to live stores.
Fail loudly	If Theme Checker fails, show the exact error message and line number. Never show a generic 'something went wrong'. The developer must be able to fix the issue without leaving ConvertFlow.
Speed is the feature	The complete extraction cycle must finish under 5 seconds. Progress is shown with real-time stage labels: Fetching theme file... Processing with AI... Validating code... Done. Developers do not wait in silence.
Keyboard shortcuts	Copy Liquid: Cmd+1. Copy CSS: Cmd+2. Copy Schema: Cmd+3. Copy Combined: Cmd+4. Push to theme: Cmd+Shift+P. Save to library: Cmd+S. Developers live on keyboards — shortcuts are not optional.
Preserve originals	Before overwriting any theme file, ConvertFlow creates a BACKUP- prefixed copy in the library. The developer can restore the original at any time with one click from the library screen.

15.2 Theme Checker Compliance — Non-Negotiable

- theme-check runs as a Node.js child process on the server before any code is returned to the developer

- Errors block the output entirely — Push to Theme button is disabled and the error is shown with line number
- Warnings are shown as amber badges but do not block output — developer can proceed with awareness
- Pass shown as green 'Theme Checker: PASS' badge — this is the trust signal developers rely on
- All generated Liquid uses `render` not `include` (`include` is deprecated in OS 2.0)
- All schema blocks include required fields: `name`, and `settings` array
- All image handling uses `image_url` filter — never hardcoded CDN or asset URLs
- No hardcoded translation strings — all visible text goes through schema settings

Section 16 — Engineering Prompt — ConvertFlow Build Instructions

Paste the following block into your AI coding assistant to build ConvertFlow as a new module inside the existing ConvertKit Remix app.

Build the ConvertFlow module as a new tab inside ConvertKit (existing Remix + Node.js 20 app).

WHAT IT DOES: Reads the merchant's Shopify theme files via Admin API (OAuth already done via ConvertKit), sends raw code to Claude API, returns production-ready Liquid + CSS + JSON schema. Developer edits in Monaco Editor and pushes back to Shopify theme. No URL input needed.

ROUTES:

```
GET /app/convertflow          - main page, load theme section list from Shopify
POST /app/convertflow/extract - sectionKey -> fetch file -> Claude -> theme-check -> return code
POST /app/convertflow/push    - processedCode + themeId -> write to Shopify theme via Admin API
POST /app/convertflow/library - save extraction to LibraryItem table
GET /app/convertflow/library  - list all LibraryItems for the shop
POST /app/convertflow/library/:id/push - push library item to any connected store
GET /app/convertflow/share/:token - public preview page (no auth required)
```

SHOPIFY API CALLS:

```
GET /admin/api/2024-01/themes.json          - identify active theme
GET /admin/api/2024-01/themes/{id}/assets.json - list all section files
GET /admin/api/2024-01/themes/{id}/assets.json?asset[key]=X - read one file
PUT /admin/api/2024-01/themes/{id}/assets.json - push code to theme
```

CLAUDE API (in /extract route):

model: claude-sonnet-4-20250514, max_tokens: 4000

System prompt: You are a Shopify Liquid expert. Clean raw Liquid + CSS into production-ready Shopify section code. Rules: (1) hardcoded text -> schema type text/richtext, (2) images -> image_picker with image_url filter format: webp + width, (3) colors -> schema type color, (4) CSS namespaced under .cf-{name}__ BEM, (5) CSS includes breakpoints at 768px and 480px, (6) schema has name, class, full settings array with id/type/label/default, (7) use render not include, (8) passes theme-check zero errors.

Output labeled sections: LIQUID, CSS, SCHEMA, COMBINED. No explanation. Code only.

THEME CHECKER:

npm install @shopify/theme-check-node

After Claude returns: write LIQUID output to temp file, run theme-check as child process, return { pass: bool, errors: [], warnings: [] } alongside the code.

Disable Push button if pass === false.

CODE EDITOR:

Monaco Editor from CDN: <https://cdn.jsdelivr.net/npm/monaco-editor/min/vs/loader.js>

Register custom Liquid tokenizer (basic: Liquid tags purple, output blue, strings yellow).

Read-only by default. Edit toggle enables editing. Show diff view before push.

DATABASE:

```
LibraryItem: id, shopId, name, tags[], liquidCode, cssCode, schemaCode,
              previewUrl, usageCount, shareToken, shareExpiresAt, createdAt
PushHistory: id, shopId, libraryItemId, targetThemeId, targetThemeName,
              pushedAt, status, errorMessage, backupLiquid
```

PUSH FLOW:

1. Show diff of current theme file vs new content
 2. Modal defaults to development theme (role=development), never active theme
 3. Before overwriting: save original content as LibraryItem with name "BACKUP-{filename}-{date}"
 4. After successful push: increment LibraryItem.usageCount, add PushHistory record
 5. On failure: show exact Shopify API error, do not increment usageCount
- ... (see engineering prompt section for full text)

LAUNCH AND QUALITY — Pre-Launch Checklist and 30-Day Targets

Section 17 — Pre-Launch Checklist and 30-Day Growth Targets

17.1 Pre-Launch Technical Checklist — ConvertKit

- GDPR webhooks verified: customers/redact, shop/redact, customers/data_request all implemented and tested
- app/uninstalled webhook deletes all shop data including sessions, sections, pages, urgency timers, review requests, analytics events
- Privacy policy and terms of service URLs configured in Shopify Partner Dashboard before submission
- App handles plan downgrades and cancellations gracefully — features deactivate without breaking the merchant's store
- Billing API tested: free trial, upgrade free to Pro, upgrade Pro to Enterprise, downgrade, cancellation, failed payment handling
- Widget bundle verified under 40kb gzipped — add CI check that fails build if bundle exceeds this
- Script injection tested on the 10 most popular Shopify themes: Dawn, Refresh, Sense, Debut, Brooklyn, Narrative, Minimal, Simple, Supply, Venture
- Sticky cart tested across Chrome, Safari, Firefox, Samsung Internet on desktop and mobile
- Urgency tools tested with edge cases: out-of-stock products, stores with no orders, zero-inventory products
- AI review writing tested with Claude API timeout and rate limit scenarios — graceful fallback verified
- Onboarding wizard tested end-to-end in under 10 minutes with a non-technical tester
- Analytics event tracking verified to not block storefront rendering — events queued and batched
- All section app blocks verified to work on OS 2.0 and OS 1.0 themes

17.2 Pre-Launch Technical Checklist — ConvertFlow

- Extraction tested on the 10 most popular Shopify themes — output verified as Theme Checker compliant for each
- Monaco Editor verified to load correctly on Chrome, Safari, Firefox desktop and Safari mobile
- Push to theme tested on both active and development themes with backup and restore verified
- Theme Checker validation tested with both passing and intentionally failing Liquid
- Share link expiry tested — expired links show clean 'This share has expired' page with no code visible
- Library push-to-any-store tested across two different Shopify stores on the same ConvertKit account
- Claude API timeout handling — if extraction exceeds 10 seconds, show error with retry button
- Redis cache invalidation — updating a theme file in Shopify directly clears ConvertFlow's cached asset list
- Shopify API rate limiting tested — ConvertFlow queues requests and never exceeds 2 per second
- GDPR: all LibraryItems, PushHistory, and Extractions deleted on uninstall webhook verified

17.3 30-Day Post-Launch Growth Targets

Week 1 target	200 installs from Product Hunt launch, r/shopify community posts, and organic Shopify App Store discovery
Week 2 target	500 installs from affiliate program activation (30% recurring commission) and YouTube tutorial content indexing
Week 3 target	1,200 installs from word of mouth among activated merchants and targeted cold email outreach to 500 merchants/week
Week 4 target	2,000 installs with paid plan conversion rate above 12% of total installs
MRR at day 30	\$3,800+ from 200 paid installs at \$19/month — growth from Pro and Enterprise upgrades
Churn target	Below 5% monthly — achieved by ensuring every merchant sees real revenue gain in their analytics dashboard within 7 days
Review target	4.7+ star average on Shopify App Store by day 30 — driven by fast onboarding and visible conversion improvement
Support target	Under 4-hour first response time, under 24-hour resolution time for all support tickets
ConvertFlow target	50+ developers actively using ConvertFlow by day 30 — measured by extraction count in analytics
Developer NPS	ConvertFlow NPS above 60 by day 30 — developers recommend tools that save them hours per week

17.4 Go-to-Market Activities by Week

When	Activity
Day 1	Product Hunt launch. r/shopify post. Shopify Partners Slack announcement. IndieHackers post.
Day 1-7	Activate 10 founding affiliate partners. Post 3 YouTube tutorials. Begin cold email outreach campaign.
Day 8-14	Publish comparison content: ConvertKit vs PageFly, ConvertFlow vs liquid-fund.com. Reach out to Shopify theme developer com
Day 15-21	Email all 500 installs: show them their conversion rate chart. Ask for App Store review. Offer to get on a call with top 10 most activ
Day 22-30	Agency outreach for Enterprise plan. Partner with 3 Shopify theme developers for bundle referrals. Publish case study from first m

This document is the complete specification for both ConvertKit and ConvertFlow. ConvertKit converts store visitors into paying customers. ConvertFlow converts developer hours into production-ready components. Together they serve two audiences from one Shopify app install, at one price point that delivers 130x ROI for merchants and hours saved per week for

developers.
